# Terminál Bloomberg

Martin Řezáč, Ondřej Pokora

# Úvod

- In 1981, Michael Bloomberg was fired from Salomon Brothers and was given a \$10 million severance package.
- Using this money, Bloomberg went on to set up a company named Innovative Market Systems
- In 1986, the company was renamed Bloomberg L.P.
- Bloomberg has since grown to be the most-used and arguably the best financial information platform
- Michael Bloomberg came to be the 10th richest person in the United States and NYC mayor from 2002 to 2013.

# Úvod

Bloomberg is also a comprehensive, intuitive news platform, with:

- 2000 journalists + 6000 news contributors
- customization
- Search filters
- Archives
- Alerts
- etc
  - a subscription is around US\$1500 per month, depending on status and included package
  - 30,146 functions
  - 300 000 subscribers

... and growing

# Úvod

- Terminál Bloomberg je počítačový systém poskytovaný firmou Bloomberg L.P., který umožňuje profesionálům v oblasti financí a dalších průmyslových odvětvích přístup k profesionálním službám Bloomberg. Jejich prostřednictvím mohou uživatelé sledovat a analyzovat data z finančních trhů v reálném čase (přístup je i k historickým datům).

# Úvod

- Systém také poskytuje zprávy, cenové nabídky a zasílání zpráv přes své proprietární zabezpečené sítě. Většina velkých finančních firem má předplatné na profesionální služby Bloomberg. V květnu 2010 využívalo terminál Bloomberg 315,000 zákazníků/ uživatelů po celém světě .

# Úvod

- Všechny terminály Bloomberg jsou pronajaty ve dvouletých cyklech (tříleté smlouvy byly možné na přelomu tisíciletí).
- Většina Bloomberg sestav má mezi dvěma a šesti displeji.

# Přihlášení

- Přihlášení do systému:

login: xxxx

heslo: xxxx

- Přihlášení do Bloombergu: stisknout červené tlačítko **Default**:

login: xxxx

heslo: xxxx

# Klávesnice

## HELPFUL KEYS:

**Esc**  
**CANCEL**

Exits the current function and cancels the current activity on the screen.

**HELP**

Connects to function Help Pages (online user guides) as well as the Bloomberg Helpdesk.

**Enter**  
**GO**

Executes a typed command.  
Also known as the <GO> key.

**SEARCH**

Enables keyword search of the entire Bloomberg database.

**END**  
**MENU**

» Navigates from any function back to a menu of related functions, then back through the menu hierarchy to the Home menu.

» Closes pop-ups.

**FB**  
**EQUITY**

The yellow market sector keys enable you to:

» Load securities  
Example: IBM US <EQUITY> <GO>

» Access market sector menus  
Example: <CORP> <GO>

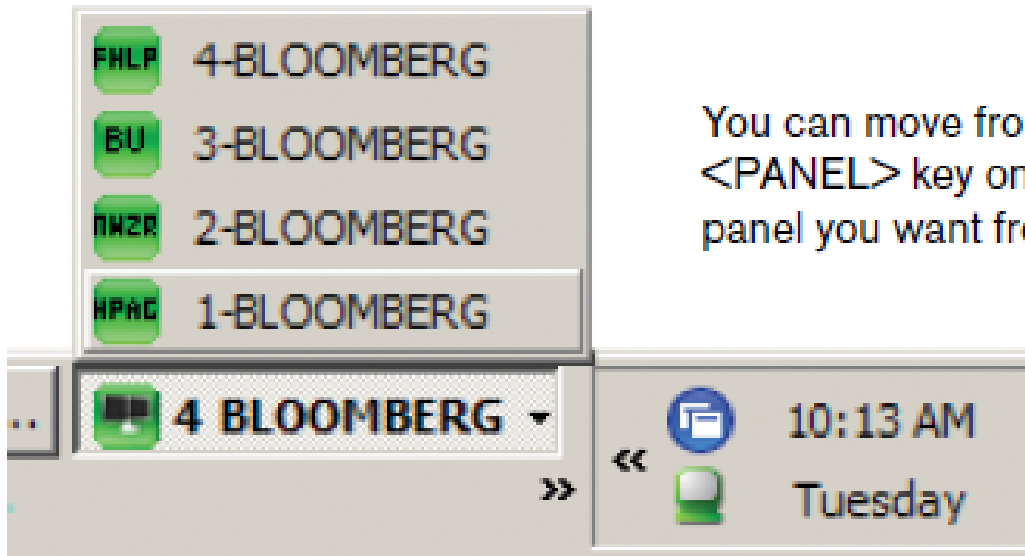

# Panely

When you first log in to Bloomberg, up to four Bloomberg Panels appear. The panels are independent workspaces that enable you to multi-task within the Bloomberg system.

You can move from one panel to another using the blue <PANEL> key on the keyboard or by clicking on the specific panel you want from the Windows taskbar (see below).

The four Bloomberg Panels enable you to work with multiple functions simultaneously. As shown below, each panel is divided into four main sections:

# Panely

A. Toolbar

B. Command Line

C. Function Area

D. Information Panel

The screenshot shows a financial news application window. The interface is divided into several sections:

- Toolbar (A):** Located at the top, it includes a search bar with the text "[HELP] for explanation..." and a user profile icon labeled "CurncyN".
- Command Line (B):** Below the toolbar, there is a navigation bar with tabs for "Home", "News", "Settings", and "Adm. Search".
- Function Area (C):** On the left side, there is a vertical menu with various options such as "My News", "Recommended", "Recently Read", "My Pages", "United States", "United States Home: CDL", "My News Page", "My Regions", "New Page", "My Admin", "SALESREPS", "HELP PORTFO...", "SEARCH", "TEST PEOPLE", "Investment 21...", "US MARKET", "U.S. FINPERS", and "Customize".
- Information Panel (D):** The main content area displays news headlines under categories like "NYC Brooklyn" and "Top U.S. News". At the bottom, there is a yellow banner with the text "SEE DEBT MATURITIES BY RANK IN CAPITAL STRUCTURE. IDDIS RANK".

# Panely

**A. Toolbar:** The left side of the toolbar includes the menu tab and a drop-down list of recently loaded securities, with the current loaded security visible. The right side features icons to help you perform key tasks, including exporting data, viewing favorite places and securities, accessing Help and adjusting your defaults and display.

**B. Command Line:** Here you enter commands for functions and securities. You can also perform a keyword search for securities and functions from the command line. This Autocomplete feature makes the Bloomberg Terminal entirely discoverable from the command line.

**C. Function Area:** Here you will find the actual function content displayed.

**D. Information Panel:** This field highlights new or enhanced Bloomberg functionality typically, but not always, related to the function that is running.

# Základní menu

The image shows a screenshot of the Bloomberg terminal interface. At the top, there is a blue header bar with the text "MENU 1-BLOOMBERG". Below this is a row of green buttons labeled "GO", "F1", "F2", "F3", "F4", "PRINT", "HELP", "MEMO", "SURVE", "QUOTE", "QUOTE", "MONIT", "NEWS", "MSG", "MENU", "PG BA", and "PG FW". Below the buttons is a search bar containing "MoM % SA Index" and navigation options "Recent", "Related", and "Favorites". A dark blue banner displays the text "<HELP> for explanation, <MENU> for similar functions." Below this is a red header bar with the text "Bloomberg". The main content area is a list of menu items, including "Market Sectors", "People", and "Trading Systems", each followed by a numbered list of sub-items.

# Základní menu

- Do základního menu se dostaneme kliknutím na , které zároveň funguje i jako tlačítko „o úroveň výš“
- Oranžové šipky  **nefungují** jako šipky v internetovém prohlížeči. Slouží na rychlý přístup k posledně zobrazovaným titulům (securities)

# Základní menu

- Příkazový řádek

```
▶ <HELP> for explanation, <MENU> fo
```

- po zadání (přibližného) klíčového slova, bloomberg nabídne související funkce a související „securities“
- např. zadáme „CEZ“, bloomberg nabídne příkazy obsahující toto heslo a cenné papíry s tímto heslem v názvu.

# Příkazový řádek

The image shows a terminal window with a dark background and light text. At the top, there is a header bar with 'CEZ' on the left and 'Equit' on the right. Below the header, the word 'FUNCTIONS' is written in orange. To the right of 'FUNCTIONS' is the text '<UP ARROW> to hide'. Below this, there is a list of search results, each starting with 'BIO' followed by a name and their affiliation. The names are: Frederic Cezard, Cezar Peralta Consing, Luiz Cezar Fernandes, Luis Fernando Cezario, Cezary Stypulkowski, Carlos Cezareto, Cezary Burzynski, Eduard Janota, and Cezary Borkowski. Below the list is the text 'More Functions...'. Below this, the word 'SECURITIES' is written in orange. Below 'SECURITIES' is another list of search results, each starting with a security code followed by a name and its location. The security codes are: CEZ CP Equity, CEZ CD Equity, CEZCO Corp, CEZ PW Equity, and CEZ CN Equity. The names are: CEZ AS (Prague), CEZ AS (Prague SPAD), CEZ AS (Multiple Matches), CEZ AS (Warsaw), and Calmena Energy Services Inc (Canada). On the right side of the terminal window, there are some partially visible text elements: 'Equit', 'ssio', and '...'.

# mnemonics

- Bloomberg používá tzv. mnemonics -
- každá funkce, příkaz, titul... má svoji zkratku
- např. ČEZ - CEZ CP Equity
- zavírací cena(last price) – px last
- apod.
- zkratky není potřebné znát, bloomberg je často intuitivně nabídne při vyhledávání

# Vyhledávání dat, správ, článku

- Nejjednodušší je vyhledávání zadáním klíčového slova do příkazového řádku
- druhá možnost je proklikat se přes položky základního menu.
  - ekonomická data například v oblasti „Market sector“
  - správy a články např. v „Other services“ – News & Research

# Vyhledávání dat, zpráv, článků

## NAVIGATING FUNCTIONS

Bloomberg functions use common screen elements that work in similar ways. Once you learn about these elements, you can use any function.

### Menu Bar

The red bar at the top of each function includes the function's title at the right and provides drop-down menus and buttons to help you perform key tasks. It may also contain a page number indicator.

### Amber-Colored Fields

Amber fields indicate areas on the screen that you can change. Amber-colored fields represent editable form elements, text and data input areas and drop-down lists.

# Performing analysis

## Clickable Areas

Moving your cursor over a clickable area of the screen shows one of three types of indicators:

- » **A White Outline Box:** Indicates most clickable items, including entries in lists, menus and tables.
- » **Numbered Information:** Numbers indicate a topical link, enabling quick access to a related page by either clicking the line or entering the number and clicking <GO>.
- » **Highlighting:** Indicates clickable buttons and tabs.

The screenshot shows a financial data table with the following content:

1)	Americas	2day	Value
4)	DOW JONES		11010.71
5)	S&P 500		1146.58
6)	NASDAQ		12224.98
7)	TSX		33283.52
8)	Number <Go>s		

Annotations in the image include:

- A white outline box around the first column (1) to 8).
- A white outline box around the 'NASDAQ' row.
- A white outline box around the 'Number <Go>s' row.
- A white outline box around the 'Value' column.
- A white outline box around the 'NASDAQ' value (12224.98).
- A white outline box around the 'Number <Go>s' value (33283.52).
- A white outline box around the '2day' column.
- A white outline box around the 'Value' column.
- A white outline box around the 'NASDAQ' value (12224.98).
- A white outline box around the 'Number <Go>s' value (33283.52).

## Keyboard Navigation

Typing in the number next to a function allows you to quickly navigate any function using only your keyboard. Many clickable onscreen options are labeled with a Number <GO>.

# Performing analysis

## STOCK/COMPANY SCREENING

The Equity Screening (EQS) function enables you to perform sophisticated searches for equity securities. There are many levels of criteria you can use in your search.

The following is a quick-start overview for using EQS.

### Step 1

» Enter **EQS <GO>**.

The Equity Screening screen appears.

The screenshot displays the Equity Screening interface. At the top, there are tabs for 'Screen Builder', 'Formula', 'Step 3', 'Actions', and 'Equity Screening'. Below these, there are several sections:

- Inverse Criteria:** A list of criteria including Exchanges, Sectors, Indices, Country of Domicile, Portfolios/Monitors, None Categories, Product Segments, Company Description, Geographic Segments, and Debt Distribution.
- Add Criteria:** A button to add new criteria.
- Criteria Options:** A section with a text prompt 'Type screening criteria and select from the suggested fields' and a 'Step 4' button.
- Options:** Two checkboxes: 'Currency conversion not selected' and 'Public/Private Company: Public'.
- Selected Screening Criteria:** A table showing the results of the screening process.

Selected Screening Criteria	Hitches
Security Universe	613135
Actively Traded Primary Security of Company (click here to view)	65221

At the bottom, there are 'Step 2' and 'Step 5' buttons, and a footer with 'Results Limited to 3000' and 'Results'.

# Performing analysis

## Step 3

» Use the Universe Criteria section to define preliminary search criteria.

a. Click a category. A window appears with options for the selected category.

b. Drag and drop the appropriate criterion from the window so that it appears in the Included Options or Excluded Options section of the window.

c. Click the **Update** button.

The criterion for the category is saved, and the window closes. The Selected Screening Criteria section at the bottom of the tab updates with your selected criterion and count of company matches.

## Step 3

» Use the Universe Criteria section to define preliminary search criteria.

a. Click a category. A window appears with options for the selected category.

b. Drag and drop the appropriate criterion from the window so that it appears in the Included Options or Excluded Options section of the window.

c. Click the **Update** button.

The criterion for the category is saved, and the window closes. The Selected Screening Criteria section at the bottom of the tab updates with your selected criterion and count of company matches.

The screenshot shows the 'Equity Screening' interface. At the top, there are tabs for 'Formula' and 'Actions'. Below that, a window titled 'Select Country of Domicile to Include/Exclude' is open. The window has a search bar at the top with the text 'Enter Query'. Below the search bar, there is a list of countries under the heading 'Country of Domicile'. The 'Czech Republic' is highlighted with a red box. To the right of the list, there is a 'Selections' section with a table. The table has two columns: 'Country of Domicile' and 'Status'. The 'Czech Republic' is listed in the first column, and 'Included' is in the second column. Below the list and selections, there are 'Update' and 'Close' buttons. At the bottom of the screenshot, there is a summary of company counts for various regions: Australia 61, 2, 9777, 8600; Brazil 5511, 3048, 4500; Europe 44, 20, 7330, 7500; Germany 3204, 1210; Hong Kong 852, 2977, 6000; Japan 81, 3, 3201, 8900; Singapore 65, 6212, 1000; U.S. 1, 212, 318, 2000; SN 876420; CET. # Performing analysis

## Step 4

» Use the Add Criteria section to refine the search with more data-driven criteria, such as industry classifications, fundamentals and ratios.

a. Click the **Fields** button.

The Browse Fields window appears with a list of all of the available search criteria fields.

b. Use the category tree or Search field at the left of the window to identify the specific criteria field for which you want to set conditions, then click the **Select** button.

The Add Criteria section of the Build/Edit Screen tab updates with the name of the selected criterion field and additional fields that allow you to set a condition(s) for the selected criterion.

c. Enter the appropriate condition(s), then press **<GO>**.

The Selected Screening Criteria section of the screen updates with your selected criterion.

# Performing analysis

## Step 5

» Once you have selected all the criteria for the search, click the **Results** button.

The list of companies (equities) matching your search criteria appears.

**Optional:** To explore further options such as saving the search or exporting the results to Excel, click the red **Output and Actions** toolbar buttons on the results page.

**Note:** To access a complete guide to using EQS, press the green **<HELP>** key once from within the EQS function.

<HELP> for explanation.

# Performing analysis

## ANALYZING A COMPANY

### Step 1

» Load the company you want to analyze.

**Example:** Enter **F US <EQUITY> <GO>**.

The company appears in the panel's toolbar as the loaded security.

# Performing analysis

## Step 2

- » Run the analysis function on the loaded security in one of the following ways:
- » Click on a category or function from the menu window—or type the mnemonic in the command field—to explore the full range of analysis options.
- » Enter the mnemonic for the specific function you want to run, then press **<GO>**.

The analysis function runs on the loaded security.

**Example:** Enter **DES <GO>**.

**Note:** Once you load a security, you can run any number of functions to analyze that security without having to re-enter the security

# Performing analysis

## Mnemonics for popular company analysis functions include:

**DES:** Company Description and Overview

**CN:** Company News

**HP:** Historical Price Table

**GP:** Historical Price Chart

**GIP:** Intraday Price Chart

**DVD:** Dividend Information

**ERN:** Earnings Summary

**FA:** Fundamentals and Financial Statements

**RG:** Total Return Comparison

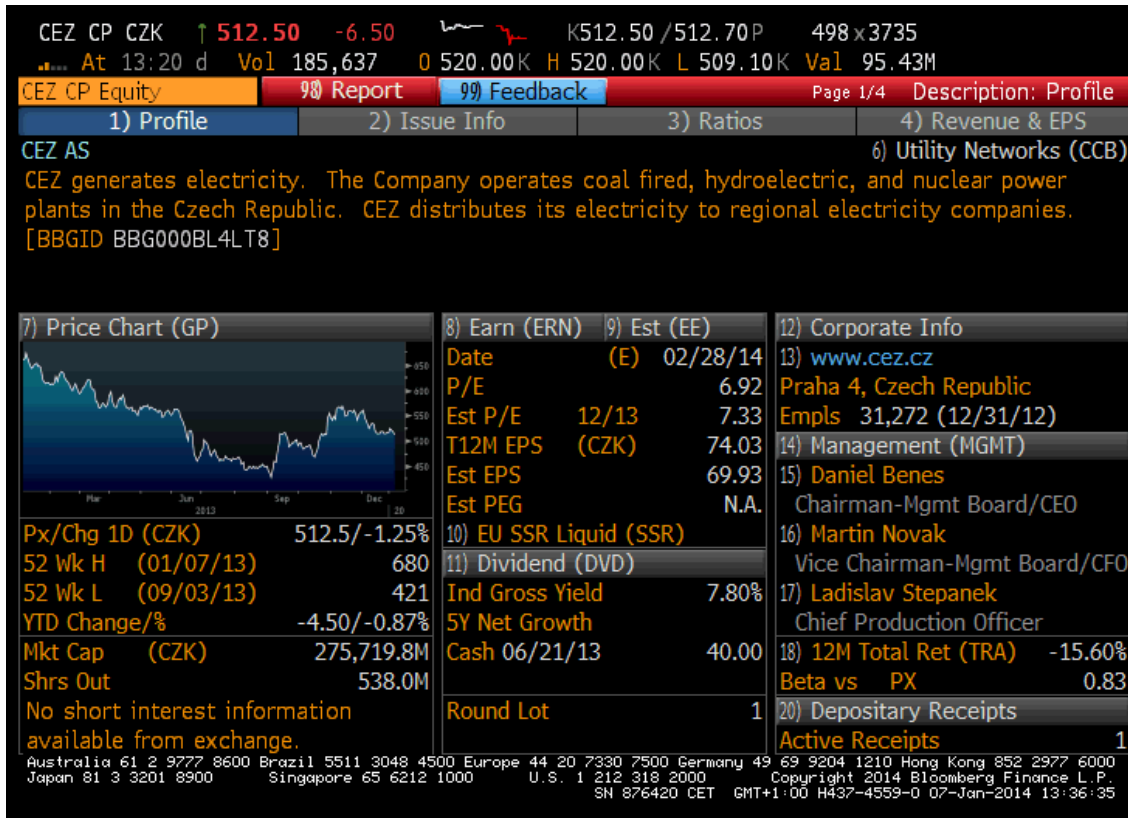

**RELS:** Capital Structure (including bonds and CDS spreads)

**G:** Technical Analysis and/or Multi-Security Charts

**Note:** To access a function's Help Page (a comprehensive user guide), press the **<HELP>** key once.

For cheatsheets that provide lists of popular analysis functions for specific security types, enter **BU <GO>**, then click the Access Training Documents link.

# Performing analysis

Vybereme si opět akcie ČEZu, zvolíme DES a klikneme na Price Chart.

# Performing analysis - Events

- Klikneme na Event a vybereme kategorii(e), které nás zajímají.
- Po najetí myši na zvolenou událost se zobrazí popis události (**červeně** jsou špatné zprávy, **zeleně** dobré)

# Performing analysis

- Klikneme na Security/Study a zvolíme „studii“ (např. zobrazení klouzavého průměru (MA) ceny cenného papíru).

# Performing analysis

- Klikneme na Report...vytvoří se pdf report, který si lze uložit pro další použití.

# Performing analysis - Report

Bloomberg

CEZ CP Equity

## CEZ AS (Utility Networks)

CEZ generates electricity. The Company operates coal fired, hydroelectric, and nuclear power plants in the Czech Republic. CEZ distributes its electricity to regional electricity companies. [BBGID BBG000BL4LT8]

## Examples:

**SPX <INDEX> <GO>** S&P 500 index

**USURTOT <INDEX> <GO>** Index tracking the US  
Unemployment Rate

**EUR <CURRENCY> <GO>** Euro spot

**F 12 5/15/15 <CORP> <GO>** Ford Motor Credit bond,  
12% coupon, matures May 15, 2015

**CL1 <CMDTY> <GO>** Front-month NYMEX-traded sweet  
crude oil futures contract

- » Run the analysis function on the loaded security in one of the following ways:
- » Click on a **category** or **function** from the menu to explore the full range of analysis options.
- » Enter the mnemonic for the function you want to run, then press **<GO>**.

For cheatsheets that provide lists of popular analysis functions for specific security types, enter **BU <GO>**, then click the [Access Training Documents](#) link.

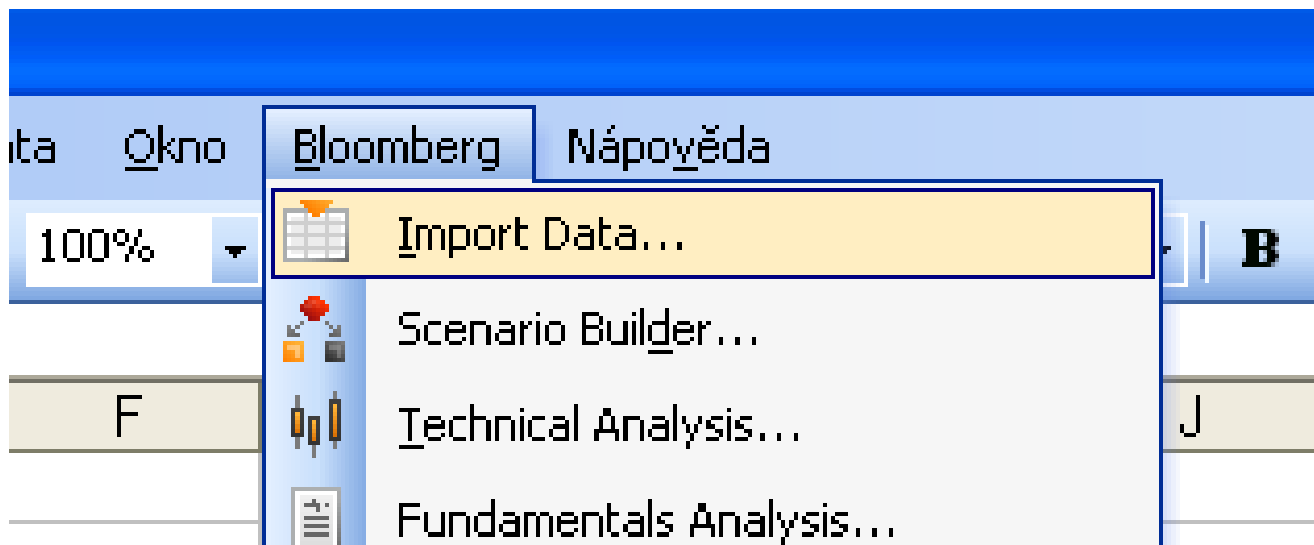

# Stahování dat – přímo

- **přímá cesta:** najdeme si v bloomeru graf (pokud nemáme odkaz na graf přímo v nabídce menu, tak lze odkaz na něj někdy zobrazit např. levým/pravým tlačítkem myši – příkaz GPO) příslušné veličiny (např. historický vývoj kurzů akcií) – zvolíme požadovaný časový interval(oranžové pole) - klikneme na graf pravým tlačítkem a vybereme možnost „Copy data to clipboard“ – následně je můžeme vložit např. do Excelu

# Stahování dat – přes excel

- V MS Excel lze využít doplňku (Add-in/API) pro propojení MS Excel a terminálu Bloomberg. Detaily viz např.  
<http://www.bloomberg.com/professional/systems-support/downloads/>,  
<http://library.nd.edu/eresources/guides/bloomberg/ExcelAddIn.pdf>
- V Excelu vybereme záložku bloomberg a následně „Import data“

# Stahování dat – přes Excel

- vybereme požadovanou oblast dat(historical, intraday...)
- následně pomocí průvodce v krocích vybereme požadované „securities“

# Stahování dat – přes Excel

- v dalších krocích: vybereme „fields“ (oblasti dat: zavírací ceny, dividendy,...) daných CP
- pokud chceme např. vybrat zavírací cenu, zadáme do pole fields heslo price, stiskneme search(nebo go) a z nabídky vybereme např. last price
- v šedém poli pod nabídkou se zobrazí popis funkce, která je právě označená
- časový interval, periodicitu a podobně...
- u zobrazeného výsledku případně upravíme v Excelu **formát buněk**

# Stahování dat – přes Excel

## Bloomberg Data Wizard - History - Step 1 of 6 - Create a list of Securities

Enter security  Selected securities

Security identifier:

Market sector:

Identifier type:

Select securities

From:

Indices:

CEZ CP Equity	CEZ AS (Prague)
CEZ CD Equity	CEZ AS (Prague SPAD)
CEZ PW Equity	CEZ AS (Warsaw)
CEZ CN Equity	Calmena Energy Services I...
CEZCO 3<5/8> 05/27/16 C...	CEZ AS
CEZ GR Equity	CEZ AS (Germany)
CEZ CK Equity	CEZ AS (Prague-Automatic)
CEZCO 4<7/8> 04/16/25 C...	CEZ AS
CEZCO 5<3/4> 05/26/15 C...	CEZ AS
CEZCO 4<1/2> 06/29/20 C...	CEZ AS

## Bloomberg Data Wizard - History - Step 2 of 6 - Create a list of Fields

Field source:

Search text:

Filter:  |

Display values for:

Categories | **List** | Favorites

Type	Name	Mnemonic	Value
	WVAP (Vol Wei...	EQY_WEIGHTED_A...

# Technická analýza

There are two principles of analysis used to forecast price movements in the financial markets -- *fundamental analysis and technical analysis*.

Fundamental analysis, depending on the market being analyzed, can deal with economic factors that focus mainly on supply and demand (commodities) or valuing a company based upon its financial strength (equities).

Fundamental analysis helps to determine **what to buy or sell**. **Technical** analysis is solely the study of market, or price action through the use of graphs and charts. Technical analysis helps to determine **when to buy and sell**.

# Technická analýza

Technical analysis has been used for thousands of years and can be applied to any market, an advantage over fundamental analysis. Most advocates of technical analysis, also called *technicians*, believe it is very likely for an investor to overlook some piece of fundamental information that could substantially affect the market. This fact, the technician believes, discourages the sole use of fundamental analysis. Technicians believe that the study of market action will tell all; that each and every fundamental aspect will be revealed through market action. Market action includes three principal sources of information available to the technician -- *price, volume, and open interest*. *Technical analysis is based upon three main premises; 1) Market action discounts everything; 2) Prices move in trends; and 3) History repeats itself.*

# BAR CHARTS

Ticker Symbol <Sector Key>GPO or IGPO<Go>

**BENEFIT:** Provides a price chart using the open, high, low and close information for the selected market along with the ability to include moving averages, volume, value traded and open interest. Shown in bar formation.

**INTERPRETATION:** Each vertical bar represents one period of price activity from the chosen periodicity. Values can be based upon, daily, weekly, monthly, quarterly or yearly data for historical charts and minute intervals for intraday charts. On a daily chart, the vertical bar represents one day's trading range whereby the top of the bar represents the market's high price of the day and the bottom of the bar represents the low. The left hash mark on the vertical bar indicates the opening price and the right hash mark on the bar indicates the closing price.

By including open, high, low and close information, bar charts allow for more detailed analysis than standard line charts. The chart also provides the option of displaying volume, value traded, and open interest if applicable. These options are listed on the top left-hand corner of the chart. Moving averages can also be displayed on the chart for prices, volume, value traded, and open interest. Enter the values immediately above the chart or save them in the technical defaults section, TDEF<Go>.

# CANDLE CHARTS

Ticker Symbol <Sector Key>GPC or IGPC<Go>

**BENEFIT:** Provides a price chart using the open, high, low and close information for the selected market along with the ability to include moving averages, volume, value traded and open interest. Shown in candle formation.

**INTERPRETATION:** Each candlestick represents one period of price activity from the chosen periodicity. Values can be based upon, daily, weekly, monthly, quarterly or yearly data for historical charts and minute intervals for intraday charts. For a daily chart, the candlestick represents one day's trading range and is displayed as *open* or *closed*. An *open candlestick* represents a higher close than open and is shown without color. A *closed candlestick* represents a lower close than open and is shown colored, usually blue. Each candlestick drawn consists of two components: the *real body* and the *shadows*. The *real body* is the thick part of the candlestick that represents the open and the close. The thin lines above and below the real body are the *shadows*. These shadows represent the session's price extremes. The shadow above the real body is called the *upper shadow*, which measures the high of the session. The shadow below the real body is called the *lower shadow* that measures the low of the session. (See CNDL<Go> for more on candlestick analysis) By including open, high, low and close information, candle charts allow for more detailed analysis than standard line charts. The chart also provides the option of displaying volume, value traded, and open interest if applicable. These options are listed on the top left-hand corner of the chart. Moving averages can also be displayed on the chart for prices, volume, value traded, and open interest. Enter the values immediately above the chart or save them in the technical defaults section, TDEF<Go>.

# BOLLINGER BANDS

Ticker symbol <Sector Key>BOLL or IBOL <Go>

**BENEFIT:** Gauges trading activity through the use of trading bands. The bands that are drawn are used to identify support and resistance levels which can assist in trading decisions.

**INTERPRETATION:** Created by John Bollinger, Bollinger Bands are a modification of trading bands, or Moving Average Envelopes (MAE). Traditionally, trading bands were drawn at fixed percentage intervals around a moving average. Bollinger Bands, however, are plotted ( $X$ ) standard deviations around a moving average. Since standard deviation is a measure of volatility, the bands are self-adjusting; they widen when volatility increases and contract when volatility decreases. As with envelopes, the basic interpretation of Bollinger Bands is that prices tend to stay within the upper and lower bands. According to John Bollinger: 1) Sharp price changes tend to occur after the bands tighten, as volatility lessens. 2) When prices move outside the bands, a continuation of the current trend is implied. 3) Bottoms and tops made outside the bands followed by bottoms and tops made inside the bands call for reversals in the trend. A move that originates at one band tends to go all the way to the other band. This observation is useful when projecting price targets. Bollinger Bands are typically drawn two standard deviations from a 20-day simple moving average for intermediate-term analysis, 10 days for short term with 1.5 standard deviations, and 50 for long-term studies with 2.5 standard deviations. The *Bandwidth* is presented just below the price chart. The band width formula is:  $(\text{top band value} - \text{bottom band value}) / (n) \text{ day arithmetic moving average} \times 100$ . This is a representation of the volatility in the security.

## **BOLLINGER BANDS CONT'D**

As the Band Width rises, volatility is increasing. As the Band Width tightens, volatility in the security's price is declining.

The %b section of the graph helps to identify when securities reach near-term support and resistance. The %b formula is:  $(\text{the security's closing price} - \text{bottom band value}) / (\text{top band value} - \text{bottom band value})$ .

**WHEN ACTION MAY BE SUGGESTED:** Like most technical indicators, Bollinger Bands have several methods of interpretation given current market conditions. In trading ranges, the location of price bars determines the strength of the current phase. Prices within the upper band signify strength while price within the lower band signals weakness. Direction of price within the band also identifies convergence and divergence with the current trend -- rising price within the lower band and falling price within the upper band signal divergence while rising within the upper band and falling within the lower band signal convergence. The lower, middle and upper bands represent support/resistance when positioned horizontally. Reversal off any band implies that price will return to the last band crossed or touched.

Price breakouts and directional momentum are signaled when price penetrates through the middle band; crossing from below center to above indicates an uptrend increase in strength while crossing from above center to below indicates a downtrend increase in weakness. If the direction of the upper band rises in response to approaching price, one can expect a series of upward prices, each riding higher along the top band. This is an uptrend in progress and is termed "climbing the ladder". Conversely, if the angle of the lower band falls in response to approaching price, one can expect a series of downward prices, each pushing lower along the bottom band. This is a downtrend in progress and is termed "the slippery slope".

# CANDLESTICK PATTERNS

Ticker Symbol <Sector Key>CNDL<Go>

Copyright 2002 Bloomberg L.P.  
I550-940-3 08-Jan-02 10:19:14

**BENEFIT:** Candlestick charting uses open, high, low, and closing prices to provide additional insight into the market supply and demand balances. CNDL identifies many common candlestick patterns that can aid in trading decisions.

**INTERPRETATION:** Although Candlestick charts have been steadily gaining acceptance here in the United States, their history of use dates back centuries in the Far East, most notably Japan. On the surface, a Candlestick chart is constructed using the same trading data as a bar chart -- they both provide the open, high, low, and closing prices for the selected security. Each candlestick drawn consists of two components: the *real body* and the *shadows*. The *real body* is the thick part of the candlestick between the open and the close. If the security closed higher than the open, it will have a white, or "open" body. If the security closed lower than it opened, it will have a blue, or "closed" body. If the security opens and closes at the same price, the candle will not have a real body -- this is called a *Doji*. The thin lines above and below the real body are the *shadows*. These shadows represent the session's price extremes. The shadow above the real body is called the *upper shadow*, which measures the high of the session. The shadow below the real body is called the *lower shadow* that measures the low of the session. The Japanese consider the real body the essential price movement; the shadows are usually looked upon as irrelevant price fluctuations.

## ***CANDLESTICK PATTERNS CONT'D***

**WHEN ACTION MAY BE SUGGESTED:** Candlestick patterns are combinations of candlestick figures, from a single candle to as many as five candle figures. Although these patterns can be viewed to confirm bullish and bearish trends, most candle patterns signal trend reversals. In either case, it must be understood that these patterns do not exist in a vacuum. Rather, pattern development can only be properly appreciated when the short-term trend immediately preceding the pattern is known. This is crucial to the proper use of Candlestick analysis. Some of the candlestick patterns to look for which signal trend changes include “morning star”, “evening star”, “hammer”, and “hanging man”. For definitions of the different types of candlestick patterns, refer to the <Help> screen for CNDL.

Some special candlesticks to look for:

**LONG DAY:** A candlestick that has a long day is one in which there has been a big difference in opening and closing price compared with typical trading days in the previous five to ten days.

**SHORT DAY:** A candlestick that has a short day is one in which there has been a small difference in opening and closing price compared with typical trading days in the previous five to ten days.

**MARUBOZU:** A marubozu candlestick is one that exhibits no (or very little) upper or lower shadow. For a white candlestick this means that its open is equal to its low, and its close is equal to its high. For a black candlestick it means that its open is equal to its high, and its close is equal to its low.

**SPINNING TOP:** A spinning top is candlestick with a small real body and long upper and lower shadows.

**DOJI:** A doji is the most extreme case of a spinning top. It occurs when the real body exists as a line (when the day's open and close are the same). A long legged doji has long upper and lower shadows. A gravestone doji has a long upper shadow and no lower shadow. A dragonfly doji has no upper shadow and a long lower shadow. And a four-price doji has no upper or lower shadows (the open, high, low, and close are the same).

**STAR:** A star is a small real body that gaps above or below a long candlestick occurring the previous day.

**UMBRELLA and INVERTED UMBRELLA:** An umbrella is similar to a dragonfly doji: a small real body with no upper shadow and a long lower shadow. An inverted umbrella is similar to a gravestone doji: a small real body with a long upper shadow and no lower shadow.

# CHAIKIN OSCILLATOR

Ticker Symbol <Sector Key>CHKO<Go>

**BENEFIT:** Shows if volume is “flowing into or out of a security.” The Chaikin Oscillator can also signal divergences to help time optimal entry and exit points.

**INTERPRETATION:** The Chaikin Oscillator, developed by Marc Chaikin, is based on the assumption that volume and price normally rise and fall together. When this relationship changes, a possible change in the price trend may result. The Chaikin Oscillator is calculated as follows:

Chaikin Oscillator = (3 day simple moving average of the ADL) - (10 day simple moving average of the ADL)

ADL =  $\frac{[(\text{close} - \text{low}) - (\text{high} - \text{close})] * \text{Volume}}{(\text{high} - \text{low})}$  Where ADL = Accumulation/Distribution line

**WHEN ACTION MAY BE SUGGESTED:** There are two ways in which the Chaikin Oscillator is used. The most important signal to note is divergence between price on the oscillator: when prices reach a new high or low in a trend and the oscillator *fails to exceed* its previous extreme reading and then reverses direction.

A second way to use the oscillator is to note changes in direction. BUY signals are given when the price of the security is above its 14-day moving average, the Oscillator turns upwards and the value of the Oscillator is negative. SELL signals are given when the price of the security is below its 14-day moving average, the Oscillator turns downwards and the value of the Oscillator is positive.

# COMMODITY CHANNEL INDEX

Ticker Symbol <Sector Key>CMCI or ICCI<Go>

**BENEFIT:** Identifies overbought/oversold conditions as well as possible divergences that can assist in identifying entry and exit points.

**INTERPRETATION:** The Commodity Channel Index (CCI), developed by Donald Lambert, measures the variation of a security's price from its statistical mean. High values show that prices are unusually high compared to average prices, whereas low values indicate that prices are unusually low. The CCI is a timing system that is best applied to securities that have cyclical or seasonal tendencies. CCI does not determine the length of cycles -- it is designed to detect when such cycles begin and end through the use of statistical analysis which incorporates a moving average and a divisor reflecting both the possible and actual trading ranges.

## **COMMODITY CHANNEL INDEX CONT'D**

**WHEN ACTION MAY BE SUGGESTED:** Like many other oscillators, there are two basic methods of interpreting the Commodity Channel Index: identifying overbought/oversold areas and price/oscillator divergent signals. The CCI typically oscillates between  $\pm 100$ . To use the CCI as an overbought/oversold indicator, readings above +100 imply an *overbought* condition, while readings below -100 imply an *oversold* condition. Signals are given when the oscillator enters either the overbought or oversold area and turns in the opposite direction.

A *divergence* occurs when the price of a security is making new highs/lows while the CCI is failing to surpass its previous highs/lows. This divergence such as this under certain market conditions may indicate a forthcoming change in trend.

# GENERAL OVERVIEW CHART (Ichimoku)

Ticker Symbol <Sector Key>GOC<Go>

**BENEFIT:** Signals the trend and near-term support and resistance of a chosen market and is used to project future market trends.

**INTERPRETATION:** The General Overview Chart was developed by Goichi Hosoda and is commonly referred to as Ichimoku Charts. There are several critical pieces of information that are presented on the chart.

First, interaction of the Conversion line (pink) and the Base Line (yellow) provides clues about near-term changes in trend. (The Base Line itself also defines bullish or bearish market trends.) Second, the Lagging Span (Gray) offers perspective on the rate of change of price movement of the underlying stock. Finally, the Leading Span 1 Line (orange) and The Leading Span 2 Line (green) works together to give insights into near-term resistance or support of the price.

About the 5 lines that are displayed:

*The Conversion Line* - the average price level between the high and the low price for the past 9-day period. This is similar to a moving average, but daily prices are not used. The difference is that only high and low prices are used.

*The Base Line* - the average price level between the high and the low price for the past 26 days. This is designed to simplify the market strength.

# MOVING AVERAGE CONVERGENCE/ DIVERGENCE

Ticker Symbol <Sector Key>MACD or IMAC<Go>

**BENEFIT:** Provides indications of the market's underlying trend. Theory suggests that when price is trending, it's expected from time to time, that speculative forces "test" the trend. By exponentially weighting price action, MACD can help to determine if it is just a short-term deviation from the trend or if it is a structural change in the trend.

**INTERPRETATION:** The MACD indicator, developed by Gerald Appel, is a trend following indicator that shows the relationship between two *exponential* moving averages of price. MACD plots the spread between a 12 and 26 period moving average and is shown in *white*. A 9-day ema of the MACD, called the "signal" line, is plotted on top of the MACD in *red*. Because the MACD is considered a trend following indicator, it proves most effective in wide-swinging or trending markets. MACD and moving averages are both examples of trend following, or "lagging" indicators.

**WHEN ACTION MAY BE SUGGESTED:** The three most popular ways to use the MACD are Crossovers, Divergences and Overbought/Oversold conditions.

### **Crossovers**

The crossover interpretation involves the signal line that is used with the MACD and helps to determine the appropriate entry and exit point. The basic MACD trading rule is to sell when the MACD falls below its signal line and to buy when the MACD rises above its signal line.

### **Divergences**

An indication that an end to the current trend may be near occurs when the MACD diverges from the security. A divergence occurs when the trend of a security's price doesn't agree with the trend of the MACD. A bearish divergence occurs when the MACD is making new lows while prices fail to reach new lows. A bullish divergence occurs when the MACD is making new highs while prices fail to reach new highs. When this occurs, prices usually change direction to confirm the trend of the MACD.

### **Overbought/Oversold Conditions**

The MACD is also useful as an overbought/oversold indicator. When the shorter moving average pulls away dramatically from the longer moving average (i.e., the MACD rises), it is likely that the security price is overextending and will soon return to more realistic levels.

### **MACD2 (line or histogram)**

MACD2 is a third indicator value that can be viewed on the chart either as a line or a histogram. MACD2 shows the difference between the MACD and the Signal. High MACD2 values are seen when trends are moving strongly in one direction, either up or down. Falling and low MACD2 values are evidence of a weakening trend and possible crossovers. A popular use of MACD2 is as an "early-warning" strategy that entails closing out the current position when the MACD2 value begins the fall from its extreme point instead of waiting for the reverse crossover to occur.

### **Popular MACD settings**

As indicated previously, MACD was introduced by Appel using a 12-day and 26-day price exponential moving average with a 9-day exponential moving average of the MACD (signal line). Other popular settings in the market include 8, 17, & 9 and 3, 6, & 9 respectively. The Bloomberg MACD defaults are 12, 26, & 9.

# MOVING AVERAGE CHART

Ticker Symbol <Sector Key>GP2<Go>

**BENEFIT:** Identifies buy and sell signals using moving average crossovers as a trading indicator. It also can identify the historical optimal crossover combinations for a given security and time period.

**INTERPRETATION:** GP2 displays a graph of three moving averages for the selected security on the top section of the chart and a profit and loss section at the bottom. (Although there are three moving average lines that can be plotted on GP2, the profit and loss graph will only interpret the crossover signals between the 2nd and 3rd moving averages entered.) The P&L section illustrates the cumulative profit or loss based on the scenario that at the first signal given, 1 unit is bought or sold and at every subsequent signal 2 units are bought or sold. This results in maintaining a long or short position at all times. Buy signals are represented by a green “B”; sell signals are represented by a red “S”. On the top left-hand portion of the GP2 chart is the optimal P&L range. It is designed to find the “best combination” of moving average crossovers for a specific security over a specific period of time. The “best combination” is defined as the combination that resulted in the highest net profit over the period of time entered on the chart. To use the optimal P&L Range, enter two sets of moving average periods under optimal P&L range 1 and range 2. GP2 will then try each combination of numbers from range 1 with numbers from range 2 until it finds the “best combination”.

# ON-BALANCE VOLUME

Ticker Symbol <Sector Key>OBV<Go>

**BENEFIT:** Measures volume activity and identifies if it is “flowing into or out of a security.” This can signal divergences that can be used as possible entry or exit points.

**INTERPRETATION:** On-balance volume, created by Joe Granville, is based on the theory that volume activity is directly proportional to the direction of true trend of a market’s price. High volume on days where the market closes higher is strong evidence of an uptrend versus low volume on those days when the market closes higher. Increased volume on the days when a market closes lower suggests a weak price action compared with a day when the market closes lower on thin volume. In theory, On-balance volume changes should precede price changes. The On-balance volume line is calculated in the following manner: If the market closes higher than the previous day’s close, then OBV will equal the previous day’s OBV, plus today’s volume. If the market closes lower than the previous day’s close, then OBV will equal the previous day’s OBV, minus today’s volume. If the market closes at the same price as the previous day’s close, then OBV will equal yesterday’s OBV. Once the OBV value is calculated each day, it is added or subtracted to the running OBV total. (The original OBV is the first day’s volume).

**WHEN ACTION MAY BE SUGGESTED:** When the OBV indicator is on a rising trend, it is generally a bullish sign, even when the market’s price may have declined slightly. When the OBV is falling, the indication is bearish even when the market may be in a short-term rally. The overall direction of line is the important factor, not the value of OBV. Historical observations suggest price ultimately follows OBV indicator when they diverge.

# RATE OF CHANGE

Ticker Symbol <Sector Key>ROC or IROC<Go>

**BENEFIT:** Measures the pace at which a security's price is changing which can help to confirm trends and forewarn of market reversals.

**INTERPRETATION:** The basis for the Rate of Change Indicator comes from the two things that propel all markets: fear and greed. The Rate of Change indicator gives visual indication of these market moods by signaling when a market is beginning to change direction. The Rate of Change Indicator compares a security's price to the price (*n*) days previous.

The Rate of Change is calculated as follows:

$$\text{Rate of Change} = ((\text{Today's close} - \text{close (n) days previous}) / \text{close (n) days previous}) * 100$$

As with many oscillators, the shorter the period used, the more sensitive the analysis. The ultimate goal is to identify timely trading signals by using a small values and eliminating false signals by comparing the signals with larger values. It is simply a matter of trying different numbers for (*n*) until you find those that best suit your trading needs.

**WHEN ACTION MAY BE SUGGESTED:** There are *three* general techniques that are used in conjunction with the Rate of Change Indicator.

**(A)** Overall, when the Rate of Change Indicator is positive, it indicates that the security is increasing in price; a negative reading indicates that price is declining. If the Rate of Change crosses the zero point of the oscillator in the same direction as the overall trend of the market, it will generally indicate a more successful trade than when the midpoint crossing is in opposition to the trend.

**(B)** Another area where the Rate of Change can provide strong indications is when the price is forming new highs (lows) and the Rate of Change is not making a higher high (lower low) relative to its most recent peak (trough). This is known as a divergent signal and can often lead to a reversal of trend. This is considered to be most useful in a sideways, or non-trending, market.

**(C)** Another technique is to watch for the Rate of Change reaching a new extreme value. This may indicate a very overbought or oversold condition that may become a peak or a bottom for the market.

# RELATIVE STRENGTH INDEX

Ticker Symbol <Sector Key>RSI or IRSI<Go>

**BENEFIT:** Measures the velocity of a security's price movements, hence identifying potential turning points. Prices are generally considered to be elastic in that they can move only so far from a mean price before retreating or accelerating. Rapid price increases result in overbought conditions and rapid price decreases result in oversold conditions, which if properly identified can assist in maximizing proper entry/exit decisions.

**INTERPRETATION:** The Relative Strength Index (RSI), an oscillator introduced by J. Welles Wilder, Jr., is in fact an internal strength indicator as it compares the price of a security relative to itself, not the relative strength of a security vs. a market. The indicator measures the relative strength of price gains on days that the security closes above the previous days close to price losses on days that the security closes below the previous days close.

The RSI is calculated by averaging up and down closes over a given period of time and inserting the result into the RSI formula,  $RSI = 100 - (100/(1+RS))$ . The result is plotted on a vertical scale of 0 to 100 and is used to demonstrate the inner strength of a price trend

**WHEN ACTION MAY BE SUGGESTED:** There are several possible interpretations for the Relative Strength Index, any of which can be very powerful depending on the market conditions and trading/investment approach. In his book, Wilder highlights five uses of the RSI: Tops and Bottoms, Chart Formations, Failure Swings, Support and Resistance, and Divergence.

### **Tops and Bottoms**

The RSI overbought/oversold indications are 70 and 30 respectively. Buy signals are triggered when RSI is in an oversold area, below 30, potentially meaning that the security is about to reach its low for this trend, and sell signals are triggered when RSI is in an overbought area, above 70, potentially signaling a market top. It usually forms these tops and bottoms before the underlying market, which can signal an impending reversal.

### **Chart Formations**

The RSI often forms chart patterns such as head and shoulders or triangles that may not be visible on the underlying price chart.

### **Failure Swings**

Also known as support or resistance penetrations or breakouts, this is where the RSI fails to surpass a previous high or low and then surpasses its most recent peak or trough. The failure swing is considered a confirmation of the impending reversal and the strongest ones occur above 70 or below 30.

### **Support and Resistance**

Levels of support and resistance are highlighted in the RSI many times before they can clearly be seen on the underlying price chart. Support/Resistance lines are drawn on the Index as they are drawn on a traditional price chart.

### **Divergences**

Divergences occur when the price makes a new high (or low) that is not confirmed by a new high (or low) in the RSI. Prices usually correct and move in the direction of the RSI.

Another method of interpretation for the RSI that is used by many is to view it as a bullish or bearish signal when it crosses 50. When the RSI crosses above 50 it can be considered bullish, and when it crosses below 50 it can be considered bearish. The concept here is that markets that are overbought will quickly turn to oversold and vice versa.

### **Popular RSI settings**

When Wilder introduced the RSI, he recommended using a 14-day RSI. Since then, 3-day, 9-day and 25-day RSI settings have also been used.

# STOCHASTICS

Ticker Symbol <Sector Key>TAS, TASC, ITAS, or ITAC<Go>

**BENEFIT:** Measures price momentum to identify overbought/oversold conditions, which may assist in maximizing entry or exit decisions.

**INTERPRETATION:** The Stochastics oscillator, developed by Dr. George Lane, uses closing prices in comparison with highs and lows of current trading ranges to indicate the trend of price movements. The premise behind the indicator is that the market will close at the upper end of a given period's trading range when the price is trending upward and that it will close at the lower range during downtrends. Peaks of the oscillator are presumed to indicate overbought positions, while minimum values of the oscillator are presumed to indicate oversold positions.

The stochastics indicator is plotted as two lines, %K and %D. The range of the stochastics oscillator is between 0 and 100. There are two types of stochastics: fast stochastics and slow stochastics. % K and % D produce what is known as the *Fast Stochastics*, which many traders feel are too erratic. To smooth this extreme sensitivity to price movement, *Slow Stochastics* were created whereby the more sensitive % K line is dropped in favor of a smoothed % D-Slow and % D is replaced by the % DS-Slow line.

When calculating fast stochastics, the raw value of %K is the point at which the current price lies within the historical price range of its given period, and the value of %D is the moving average of %K over a given number of periods.

When calculating slow stochastics, the value of %K slow is the %D-period moving average of the point at which the current price lies within the historical price range of its given period (or raw %K), and the value of %D slow is the moving average of the %K slow over a given number of periods.

The actual calculations of the indicator are as follows:

$\% K = 100 \left[ \frac{C - L(n)}{H(n) - L(n)} \right]$  where C is the current close, L (n) is the low of the (n) period, and H (n) is the high of the (n) day period.

$\% D$  = a moving average of % K for the specified period.

$\% D\text{-Slow}$  = a moving average of % D for the specified period.

$\% DS\text{-Slow}$  = a moving average of % D-Slow for the specified period.

**WHEN ACTION MAY BE SUGGESTED:** Stochastics can be used with several interpretations: among them are divergences, crossovers, and overbought/oversold breakouts.

### **Divergences**

One interpretation (and the one Lane believes to be most important) is to look for divergences between the stochastic oscillator and the price. An overbought market occurs when the oscillator makes a series of lower highs while the price makes a series of higher highs. An oversold market occurs when the price makes a series of lower lows while the oscillator makes a series of higher lows. When a divergence occurs between an indicator and prices, the indicator typically provides the clue as to where prices will head.

### **Crossovers**

A second interpretation is to receive signals based on a crossover of the two lines. When the %K line rises above the %D line it is considered bullish, and when the %K line falls below the %D line, it is considered bearish. You can eliminate some false signals by using only the signals that correspond to the direction of the intermediate- to long-term trends.

### **Overbought/oversold breakouts**

A third interpretation is that a buy signal is generated when either line dips below and then rises above 20, and a bearish signal is generated when either line rises above and then dips below 80.
